

Access to the DEEP-EST prototype

Step 1: JuDoor Account

At first you have to create an account on our JuDoor portal. Please look [here](#) to proceed with the account creation and your first steps on the portal.

Step 2: Request compute resources on the DEEP-EST prototype

After the creation of your JuDoor account, you have to apply to a compute project to access the prototype and to a data project to be assigned space on the shared filesystems.

There are two different ways for this:

- You want to join an existing project on the DEEP-EST prototype? Then please look [here](#).

After being granted access to a compute (and data) project, you can request access to any system the project is allowed to. Please select for `DEEP` among the systems available on your compute project. Before accessing the system, please remember to read the usage conditions and digitally sign them. Also, you will have to upload a copy of your SSH public key via JuDoor in order to access the system.

Step 3: Using the system

Once access is granted you can reach the system with your JuDoor account via SSH: `deep.fz-juelich.de`. Now you are ready to have a look at the other topics in our [Tutorial](#).

For any question or issue, please contact `?access(at)deep-est.eu` (if you are an EAP user) or `sup(at)deep-est.eu` (if you are a DEEP-EST member).

The old version of "Get an account" can be found [here](#).
