Information about the batch system (SLURM)

Please confer `/etc/slurm/README`.

The documentation of Slurm can be found [?here](#).

Overview

Slurm offers interactive and batch jobs (scripts submitted into the system). The relevant commands are `srun` and `sbatch`. The `srun` command can be used to spawn processes (**please do not use `mpirun`**), both from the frontend and from within a batch script. You can also get a shell on a node to work locally there (e.g. to compile your application natively for a special platform).

Available Partitions

Please note that there is no default partition configured. In order to run a job, you have to specify one of the following partitions, using the `--partition=...` switch:

Name	Description
dp-cn	dp-cn[01-50], DEEP-EST Cluster nodes (Xeon Skylake)
dp-dam	dp-dam[01-16], DEEP-EST Dam nodes (Xeon Cascadelake + 1 V100 + 1 Stratix 10)
dp-dam-ext	dp-dam[09-16], DEEP-EST Dam nodes connected with Extoll Tourmalet
dp-sdv-esb	dp-sdv-esb[01-02], DEEP-EST ESB Test nodes (Xeon Cascadelake + 1 V100)
ml-gpu	ml-gpu[01-03], GPU test nodes for ML applications (up to 4 V100 cards)
sdv	deeper-sdv[01-16], cluster test nodes with Xeon Haswell CPU
extoll	deeper-sdv[01-16] (these nodes use an Extoll Tourmalet fabric)
knl	knl[01,04-06], KNL nodes
knl256	knl[01,05], KNL nodes with 64 cores
knl272	knl[04,06], KNL nodes with 68 cores
snc4	knl[05], KNL node in snc4 memory mode
psgw-cluster	gateway test node
psgw-booster	gateway test node
debug	all compute nodes (no gateways)

Anytime, you can list the state of the partitions with the `sinfo` command. The properties of a partition can be seen using

```
scontrol show partition <partition>
```

Remark about environment

By default, Slurm passes the environment from your job submission session directly to the execution environment. Please be aware of this when running jobs with `srun` or when submitting scripts with `sbatch`. This behavior can be controlled via the `--export` option. Please refer to the [?Slurm documentation](#) to get more information about this.

In particular, when submitting job scripts, it is recommended to load the necessary modules within the script and submit the script from a clean environment.

An introductory example

Suppose you have an mpi executable named `hello_mpi`. There are three ways to start the binary.

From a shell on a node

First, start a shell on a node. You would like to run your mpi task on 4 machines with 2 tasks per machine:

```
[kreutz1@deepv /p/project/cdeep/kreutz1/Temp]$ srun -p dp-cn -N 4 -n 8 -t 00:30:00 --pty /bin/bash -i
[kreutz1@dp-cn01 /p/project/cdeep/kreutz1/Temp]$
```

The environment is transported to the remote shell, no `.profile`, `.bashrc`, ... are sourced (especially not the modules default from `/etc/profile.d/modules.sh`).

Once you get to the compute node, start your application using `srun`. Note that the number of tasks used is the same as specified in the initial `srun` command above (4 nodes with two tasks each):

```
[kreutz1@deepv Temp]$ srun -p dp-cn -N 4 -n 8 -t 00:30:00 --pty /bin/bash -i
[kreutz1@dp-cn01 Temp]$ srun ./MPI_HelloWorld
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 0 of 8 on dp-cn01
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 5 of 8 on dp-cn03
```

You can ignore potential warnings about the cpu binding. ParaStation will pin your processes.

Running directly from the front ends

You can run the application directly from the frontend, bypassing the shell:

```
[kreutz1@deepv Temp]$ srun -p dp-cn -N 4 -n 8 -t 00:30:00 ./MPI_HelloWorld
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 0 of 8 on dp-cn01
Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 5 of 8 on dp-cn03
```

In this case, it can be useful to create an allocation which you can use for several runs of your job:

```
[kreutz1@deepv Temp]$ salloc -p dp-cn -N 4 -n 8 -t 00:30:00
salloc: Granted job allocation 69263
[kreutz1@deepv Temp]$ srun ./MPI_HelloWorld
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 5 of 8 on dp-cn03
Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 0 of 8 on dp-cn01
...
# several more runs
...
[kreutz1@deepv Temp]$ exit
exit
salloc: Relinquishing job allocation 69263
```

Batch script

Given the following script `hello_cluster.sh`:

```
#!/bin/bash

#SBATCH --partition=dp-cn
#SBATCH -N 4
#SBATCH -n 8
#SBATCH -o /p/project/cdeep/kreutzl/hello_cluster-%j.out
#SBATCH -e /p/project/cdeep/kreutzl/hello_cluster-%j.err
#SBATCH --time=00:10:00

srun ./MPI_HelloWorld
```

This script requests 4 nodes with 8 tasks, specifies the stdout and stderr files, and asks for 10 minutes of walltime. Submit:

```
[kreutzl@deepv Temp]$ sbatch hello_cluster.sh
Submitted batch job 69264
```

Check what it's doing:

```
[kreutzl@deepv Temp]$ squeue -u $USER
      JOBID PARTITION     NAME     USER ST       TIME  NODES NODELIST(REASON)
      69264      dp-cn hello_cl  kreutzl CG        0:04      4 dp-cn[01-04]
```

Check the result:

```
[kreutzl@deepv Temp]$ cat /p/project/cdeep/kreutzl/hello_cluster-69264.out
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 0 of 8 on dp-cn01
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 5 of 8 on dp-cn03
Hello World from rank 1 of 8 on dp-cn01
```

Heterogeneous jobs

As of version 17.11 of Slurm, heterogeneous jobs are supported. For example, the user can run:

```
srun --partition=dp-cn -N 1 -n 1 hostname : --partition=dp-dam -N 1 -n 1 hostname
dp-cn01
dp-dam01
```

Please notice the `:` separating the definitions for each sub-job of the heterogeneous job. Also, please be aware that it is possible to have more than two sub-jobs in a heterogeneous job.

The user can also request several sets of nodes in a heterogeneous allocation using `salloc`. For example:

```
salloc --partition=dp-cn -N 2 : --partition=dp-dam -N 4
```

In order to submit a heterogeneous job via `sbatch`, the user needs to set the batch script similar to the following one:

```
#!/bin/bash

#SBATCH --job-name=imb_execute_1
#SBATCH --account=deep
```

```

#SBATCH --mail-user=
#SBATCH --mail-type=ALL
#SBATCH --output=job.out
#SBATCH --error=job.err
#SBATCH --time=00:02:00

#SBATCH --partition=dp-cn
#SBATCH --nodes=1
#SBATCH --ntasks=12
#SBATCH --ntasks-per-node=12
#SBATCH --cpus-per-task=1

#SBATCH packjob

#SBATCH --partition=dp-dam
#SBATCH --constraint=
#SBATCH --nodes=1
#SBATCH --ntasks=12
#SBATCH --ntasks-per-node=12
#SBATCH --cpus-per-task=1

srun ./app_cn : ./app_dam

```

Here the `packjob` keyword allows to define Slurm parameters for each sub-job of the heterogeneous job. Some Slurm options can be defined once at the beginning of the script and are automatically propagated to all sub-jobs of the heterogeneous job, while some others (i.e. `--nodes` or `--ntasks`) must be defined for each sub-job. You can find a list of the propagated options on the [?Slurm documentation](#).

When submitting a heterogeneous job with this colon notation using ParaStationMPI, a unique `MPI_COMM_WORLD` is created, spanning across the two partitions. If this is not desired, one can use the `--pack-group` key to submit independent job steps to the different node-groups of a heterogeneous allocation:

```
srun --pack-group=0 ./app_cn ; srun --pack-group=1 ./app_dam
```

Using this configuration implies that inter-communication must be established manually by the applications during run time, if needed.

For more information about heterogeneous jobs please refer to the [?relevant page](#) of the Slurm documentation.

Heterogeneous jobs with MPI communication across modules

In order to establish MPI communication across modules using different interconnect technologies, some special Gateway nodes must be used. On the DEEP-EST system, MPI communication across gateways is needed only between Infiniband and Extoll interconnects. **Attention:** Only ParaStation MPI supports MPI communication across gateway nodes.

This is an example job script for setting up an Intel MPI benchmark between a Cluster and a DAM node using a IB ↔ Extoll gateway for MPI communication:

```

#!/bin/bash

# Script to launch IMB PingPong between DAM-CN using 1 Gateway
# Use the gateway allocation provided by SLURM
# Use the packjob feature to launch separately CM and DAM executable

#SBATCH --job-name=imb
##SBATCH --account=cdeep
#SBATCH --output=IMB-%j.out
#SBATCH --error=IMB-%j.err
#SBATCH --time=00:05:00
#SBATCH --gw_num=1
#SBATCH --gw_binary=/opt/parastation/bin/psgwd.extoll
#SBATCH --gw_psgwd_per_node=1

```

```
#SBATCH --partition=dp-cn
#SBATCH --nodes=1
#SBATCH --ntasks=1

#SBATCH packjob

#SBATCH --partition=dp-dam-ext
#SBATCH --nodes=1
#SBATCH --ntasks=1

echo "DEBUG: SLURM_JOB_NODELIST=$SLURM_JOB_NODELIST"
echo "DEBUG: SLURM_NNODES=$SLURM_NNODES"
echo "DEBUG: SLURM_TASKS_PER_NODE=$SLURM_TASKS_PER_NODE"

# Execute
srun hostname : hostname
srun module_dp-cn.sh : module_dp-dam-ext.sh
```

It uses two execution scripts for loading the correct environment and starting the IMB on the CM and the DAM node (this approach can also be used to start different programs, e.g. one could think of a master and worker use case). The execution scripts could look like:

```
#!/bin/bash
# Script for the CN using InfiniBand

module load Intel ParaStationMPI pscom

# Execution
EXEC=$PWD/mpi-benchmarks/IMB-MPI1
LD_LIBRARY_PATH=/opt/parastation/lib64:$LD_LIBRARY_PATH PSP_OPENIB_HCA=mlx5_0 ${EXEC} PingPong
```

```
#!/bin/bash
# Script for the DAM using Extoll

module load Intel ParaStationMPI pscom extoll

# Execution
EXEC=$PWD/mpi-benchmarks/IMB-MPI1
LD_LIBRARY_PATH=/opt/parastation/lib64:/opt/extoll/x86_64/lib:$LD_LIBRARY_PATH PSP_DEBUG=3 PSP_EXTOLL=1 PSP_VELO=1 PSP_REN
```

Attention: During the first part of 2020, only the DAM nodes will have Extoll interconnect, while the CM and the ESB nodes will be connected via Infiniband. This will change later during the course of the project (expected Summer 2020), when the ESB will be equipped with Extoll connectivity (Infiniband will be removed from the ESB and left only for the CM).

A general description of how the user can request and use gateway nodes is provided at [?this section](#) of the JURECA documentation.

Attention: some information provided on the JURECA documentation do not apply for the DEEP system. In particular:

- as of 09/01/2020, the DEEP system has 1 gateway node. In the next weeks at least one additional gateway node will be installed.
- As of 09/01/2020 the gateway nodes are exclusive to the job requesting them. Given the limited number of gateway nodes available on the system, this may change in the future.
- The `xenv` utility (necessary on JURECA to load modules for different architectures - Haswell and KNL) is needed on DEEP only to load the `extoll` module on the DAM and ESB nodes (the `extoll` module is not available on the CM. Trying to load it there will produce an error and cause the job to fail). All the other modules can be loaded via the usual `module load` or `ml` command on the batch script before the `srun` command. If desired, `xenv` can still be used to load different set of modules for different sub-jobs of a heterogeneous jobs.

Information on past jobs and accounting

The `sacct` command can be used to enquire the Slurm database about a past job.

```
[kreutzl@deepv Temp]$ sacct -j 69268
```

JobID	JobName	Partition	Account	AllocCPUS	State	ExitCode
69268+0	bash	dp-cn	deepest-a+	96	COMPLETED	0:0
69268+0.0	MPI_Hello+		deepest-a+	2	COMPLETED	0:0
69268+1	bash	dp-dam	deepest-a+	384	COMPLETED	0:0

FAQ

Is there a cheat sheet for all main Slurm commands?

Yes, it is available [?here](#).

Why's my job not running?

You can check the state of your job with

```
scontrol show job <job id>
```

In the output, look for the `Reason` field.

You can check the existing reservations using

```
scontrol show res
```

How can I check which jobs are running in the machine?

Please use the `squeue` command (the `"-u $USER"` option to only list jobs belonging to your user id).

How do I do chain jobs with dependencies?

Please confer the `sbatch/srun` man page, especially the

```
-d, --dependency=<dependency_list>
```

entry.

Also, jobs can be chained after they have been submitted using the `scontrol` command by updating their `Dependency` field.

How can check the status of partitions and nodes?

The main command to use is `sinfo`. By default, when called alone, `sinfo` will list the available partitions and the number of nodes in each partition in a given status. For example:

```
[deamicisl@deepv hybridhello]$ sinfo
```

PARTITION	AVAIL	TIMELIMIT	NODES	STATE	NODELIST
sdv	up	20:00:00	16	idle	deeper-sdv[01-16]
kn1	up	20:00:00	1	drain	kn101
kn1	up	20:00:00	3	idle	kn1[04-06]
kn1256	up	20:00:00	1	drain	kn101
kn1256	up	20:00:00	1	idle	kn105
kn1272	up	20:00:00	2	idle	kn1[04,06]
snc4	up	20:00:00	1	idle	kn105
dam	up	20:00:00	1	down*	protodam01
dam	up	20:00:00	3	idle	protodam[02-04]
extoll	up	20:00:00	16	idle	deeper-sdv[01-16]
ml-gpu	up	20:00:00	1	idle	ml-gpu01
dp-cn	up	20:00:00	1	drain	dp-cn49
dp-cn	up	20:00:00	2	alloc	dp-cn[01,50]
dp-cn	up	20:00:00	47	idle	dp-cn[02-48]

```

dp-dam      up    20:00:00      1 drain* dp-dam01
dp-dam      up    20:00:00      1 drain dp-dam02
dp-dam      up    20:00:00     14 down dp-dam[03-16]
dp-sdv-esb  up    20:00:00      2 idle dp-sdv-esb[01-02]
psgw-cluster up    20:00:00      1 down* nfgw01
psgw-booster up    20:00:00      1 down* nfgw02
debug       up    20:00:00      1 drain* dp-dam01
debug       up    20:00:00      1 down* protodam01
debug       up    20:00:00      3 drain dp-cn49,dp-dam02, knl01
debug       up    20:00:00     14 down dp-dam[03-16]
debug       up    20:00:00      2 alloc dp-cn[01,50]
debug       up    20:00:00     69 idle deeper-sdv[01-16],dp-cn[02-48],knl[04-06],protodam[02-04]

```

Please refer to the man page for `sinfo` for more information.

Can I join `stderr` and `stdout` like it was done with `-joe` in Torque?

Not directly. In your batch script, redirect `stdout` and `stderr` to the same file:

```

...
#SBATCH -o /point/to/the/common/logfile-%j.log
#SBATCH -e /point/to/the/common/logfile-%j.log
...

```

(The `%j` will place the job id in the output file). N.B. It might be more efficient to redirect the output of your script's commands to a dedicated file.

What is the default binding/pinning behaviour on DEEP?

DEEP uses a ParTec-modified version of Slurm called `psslurm`. In `psslurm`, the options concerning binding and pinning are different from the ones provided in Vanilla Slurm. By default, `psslurm` will use a *by rank* pinning strategy, assigning each Slurm task to a different physical thread on the node starting from OS processor 0. For example:

```

[deamicis1@deepv hybridhello]$ OMP_NUM_THREADS=1 srun -N 1 -n 4 -p dp-cn ./HybridHello | sort -k9n -k11n
Hello from node dp-cn50, core 0; AKA rank 0, thread 0
Hello from node dp-cn50, core 1; AKA rank 1, thread 0
Hello from node dp-cn50, core 2; AKA rank 2, thread 0
Hello from node dp-cn50, core 3; AKA rank 3, thread 0

```

Attention: please be aware that the `psslurm` affinity settings only affect the tasks spawned by Slurm. When using threaded applications, the thread affinity will be inherited from the task affinity of the process originally spawned by Slurm. For example, for a hybrid MPI-OpenMP application:

```

[deamicis1@deepv hybridhello]$ OMP_NUM_THREADS=4 srun -N 1 -n 4 -c 4 -p dp-dam ./HybridHello | sort -k9n -k11n
Hello from node dp-dam01, core 0-3; AKA rank 0, thread 0
Hello from node dp-dam01, core 0-3; AKA rank 0, thread 1
Hello from node dp-dam01, core 0-3; AKA rank 0, thread 2
Hello from node dp-dam01, core 0-3; AKA rank 0, thread 3
Hello from node dp-dam01, core 4-7; AKA rank 1, thread 0
Hello from node dp-dam01, core 4-7; AKA rank 1, thread 1
Hello from node dp-dam01, core 4-7; AKA rank 1, thread 2
Hello from node dp-dam01, core 4-7; AKA rank 1, thread 3
Hello from node dp-dam01, core 8-11; AKA rank 2, thread 0
Hello from node dp-dam01, core 8-11; AKA rank 2, thread 1
Hello from node dp-dam01, core 8-11; AKA rank 2, thread 2
Hello from node dp-dam01, core 8-11; AKA rank 2, thread 3
Hello from node dp-dam01, core 12-15; AKA rank 3, thread 0
Hello from node dp-dam01, core 12-15; AKA rank 3, thread 1
Hello from node dp-dam01, core 12-15; AKA rank 3, thread 2
Hello from node dp-dam01, core 12-15; AKA rank 3, thread 3

```
