Information about the batch system (SLURM)

The DEEP prototype system is running SLURM for resource management. Documentation of Slurm can be found [?here](#).

Overview

Slurm offers interactive and batch jobs (scripts submitted into the system). The relevant commands are `srun` and `sbatch`. The `srun` command can be used to spawn processes (**please do not use `mpiexec`**), both from the frontend and from within a batch script. You can also get a shell on a node to work locally there (e.g. to compile your application natively for a special platform or module).

Available Partitions

Please note that there is no default partition configured. In order to run a job, you have to specify one of the following partitions, using the `--partition=...` switch:

| Name | Description |
|------------|--|
| dp-cn | dp-cn[01-50], DEEP Cluster nodes (Xeon Skylake) |
| dp-dam | dp-dam[01-16], DEEP DAM nodes (Xeon Cascadelake + 1 V100 + 1 Stratix 10) |
| dp-esb | dp-esb[log:@26-75 "[01-75]"], DEEP ESB nodes connected with IB EDR (Xeon Cascadelake + 1 V100) |
| dp-sdv-esb | dp-sdv-esb[01-02], DEEP ESB Test nodes (Xeon Cascadelake + 1 V100) |
| ml-gpu | ml-gpu[01-03], GPU test nodes for ML applications (4 V100 cards) |
| knl | knl[01,04-06], KNL nodes |
| knl256 | knl[01,05], KNL nodes with 64 cores |
| knl272 | knl[04,06], KNL nodes with 68 cores |
| snc4 | knl[05], KNL node in snc4 memory mode |
| debug | all compute nodes (no gateways) |

Anytime, you can list the state of the partitions with the `sinfo` command. The properties of a partition (e.g. the maximum walltime) can be seen using

```
scontrol show partition <partition>
```

Remark about environment

By default, Slurm passes the environment from your job submission session directly to the execution environment. Please be aware of this when running jobs with `srun` or when submitting scripts with `sbatch`. This behavior can be controlled via the `--export` option. Please refer to the [?Slurm documentation](#) to get more information about this.

In particular, when submitting job scripts, **it is recommended to load the necessary modules within the script and submit the script from a clean environment.**

An introductory example

Suppose you have an mpi executable named `hello_mpi`. There are three ways to start the binary.

From a shell on a node

If you just need one node to run your interactive session on you can simply use the `srun` command (without `salloc`), e.g.:

```
[kreutzl@deepv ~]$ srun -A deep -N 1 -n 8 -p dp-cn -t 00:30:00 --pty --interactive bash
[kreutzl@dp-cn22 ~]$ srun -n 8 hostname
dp-cn22
```

```
dp-cn22
dp-cn22
dp-cn22
dp-cn22
dp-cn22
dp-cn22
dp-cn22
```

The environment is transported to the remote shell, no `.profile`, `.bashrc`, ... are sourced (especially not the modules default from `/etc/profile.d/modules.sh`). As of March 2020, an account has to be specified using the `--account` (short `-A`) option, which is "deepsea" for DEEP-SEA project members. For people not included in the DEEP-SEA project, please use the "Budget" name you received along with your account creation.

Assume you would like to run an MPI task on 4 cluster nodes with 2 tasks per node. It's necessary to use `salloc` then:

```
[kreutz1@deepv Temp]$ salloc -A deep -p dp-cn -N 4 -n 8 -t 00:30:00 srun --pty --interactive /bin/bash
[kreutz1@dp-cn01 Temp]$ srun -N 4 -n 8 ./MPI_HelloWorld
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 0 of 8 on dp-cn01
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 5 of 8 on dp-cn03
```

Once you get to the compute node, start your application using `srun`. Note that the number of tasks used is the same as specified in the initial `srun` command above (4 nodes with two tasks each). It's also possible to use less nodes in the `srun` command. So the following command would work as well:

```
[kreutz1@dp-cn01 Temp]$ srun -N 1 -n 1 ./MPI_HelloWorld
Hello World from rank 0 of 1 on dp-cn01
```

Running directly from the front ends

You can run the application directly from the frontend, bypassing the shell. Do not forget to set the correct environment for running your executable on the login node as this will be used for execution with `srun`.

```
[kreutz1@deepv Temp]$ ml GCC/10.3.0 ParaStationMPI/5.4.9-1
[kreutz1@deepv Temp]$ srun -A deep -p dp-cn -N 4 -n 8 -t 00:30:00 ./MPI_HelloWorld
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 0 of 8 on dp-cn01
Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 5 of 8 on dp-cn03
```

It can be useful to create an allocation which can be used for several runs of your job:

```
[kreutz1@deepv Temp]$ salloc -A deep -p dp-cn -N 4 -n 8 -t 00:30:00
salloc: Granted job allocation 69263
[kreutz1@deepv Temp]$ srun ./MPI_HelloWorld
Hello World from rank 7 of 8 on dp-cn04
Hello World from rank 3 of 8 on dp-cn02
Hello World from rank 6 of 8 on dp-cn04
Hello World from rank 2 of 8 on dp-cn02
Hello World from rank 5 of 8 on dp-cn03
```

```

Hello World from rank 1 of 8 on dp-cn01
Hello World from rank 4 of 8 on dp-cn03
Hello World from rank 0 of 8 on dp-cn01
...
# several more runs
...
[kreutz1@deepv Temp]$ exit
exit
salloc: Relinquishing job allocation 69263

```

Note that in this case the `-N` and `-n` options for the `srun` command can be skipped (they default to the corresponding options given to `salloc`).

Batch script

As stated above, it is recommended to load the necessary modules within the script and submit the script from a clean environment.

The following script `hello_cluster.sh` will unload all modules and load the modules required for executing the given binary:

```

#!/bin/bash

#SBATCH --partition=dp-esb
#SBATCH -A deep
#SBATCH -N 4
#SBATCH -n 8
#SBATCH -o /p/project/cdeep/kreutz1/hello_cluster-%j.out
#SBATCH -e /p/project/cdeep/kreutz1/hello_cluster-%j.err
#SBATCH --time=00:10:00

ml purge
ml GCC ParaStationMPI
srun ./MPI_HelloWorld

```

This script requests 4 nodes of the ESB module with 8 tasks, specifies the stdout and stderr files, and asks for 10 minutes of walltime. You can submit the job script as follows:

```

[kreutz1@deepv Temp]$ sbatch hello_cluster.sh
Submitted batch job 69264

```

... and check what it's doing:

```

[kreutz1@deepv Temp]$ squeue -u $USER
      JOBID PARTITION    NAME     USER ST       TIME  NODES NODELIST(REASON)
      69264      dp-cn hello_cl  kreutz1 CG        0:04      4 dp-cn[01-04]

```

Once finished, you can check the result (and the error file if needed)

```

[kreutz1@deepv Temp]$ cat /p/project/cdeep/kreutz1/hello_cluster-69264.out
Hello World from rank 7 of 8 on dp-esb37
Hello World from rank 3 of 8 on dp-esb35
Hello World from rank 5 of 8 on dp-esb36
Hello World from rank 1 of 8 on dp-esb34
Hello World from rank 6 of 8 on dp-esb37
Hello World from rank 2 of 8 on dp-esb35
Hello World from rank 4 of 8 on dp-esb36
Hello World from rank 0 of 8 on dp-esb34

```

Information on past jobs and accounting

The `sacct` command can be used to enquire the Slurm database about a past job.

```
[kreutzl@deepv Temp]$ sacct -j 69268
```

| JobID | JobName | Partition | Account | AllocCPUS | State | ExitCode |
|-----------|------------|-----------|------------|-----------|-----------|----------|
| 69268+0 | bash | dp-cn | deepest-a+ | 96 | COMPLETED | 0:0 |
| 69268+0.0 | MPI_Hello+ | | deepest-a+ | 2 | COMPLETED | 0:0 |
| 69268+1 | bash | dp-dam | deepest-a+ | 384 | COMPLETED | 0:0 |

On the Cluster (CM) nodes it's possible to query the consumed energy for a certain job:

```
[kreutzl@deepv kreutzl]$ sacct -o ConsumedEnergy,JobName,JobID,CPUTime,AllocNodes -j 69326
```

| ConsumedEnergy | JobName | JobID | CPUTime | AllocNodes |
|----------------|------------|-------------|----------|------------|
| 496.70K | hpl_MKL_O+ | 69326 | 16:28:48 | 1 |
| 0 | batch | 69326.batch | 16:28:48 | 1 |
| 496.70K | xlinpack_+ | 69326.0 | 08:10:24 | 1 |

This feature will also be for the ESB nodes.

Advanced topics

For further details on the batchsystem and psslurm which is used on the DEEP system as well as on the JSC production systems, please refer to the in-depth description for using the [Batchsystem on Jureca](#). Among extended examples for allocation of nodes you can find information on job steps, dependency chains and multithreading there. If you are interested in pinning of threads and tasks to certain CPUs or cores, please also take a look into the [Processor Anfinity](#) sections of the Jureca documentation. Most of the information provided there will also refer to the DEEP system.

FAQ

Is there a cheat sheet for all main Slurm commands?

Yes, it is available [here](#).

Why's my job not running?

You can check the state of your job with

```
scontrol show job <job id>
```

In the output, look for the Reason field.

You can check the existing reservations using

```
scontrol show res
```

How can I check which jobs are running in the machine?

Please use the `squeue` command (the "-u \$USER" option to only list jobs belonging to your user id). A graphical overview can be displayed using `slurmtop` command.

How do I do chain jobs with dependencies?

Please confer the `sbatch/srun` man page, especially the

```
-d, --dependency=<dependency_list>
```

entry.

Also, jobs can be chained after they have been submitted using the `scontrol` command by updating their `Dependency` field.

How can check the status of partitions and nodes?

The main command to use is `sinfo`. By default, when called alone, `sinfo` will list the available partitions and the number of nodes in each partition in a given status. For example:

```
[deamicisl@deepv hybridhello]$ sinfo
PARTITION    AVAIL    TIMELIMIT    NODES    STATE NODELIST
sdv           up      20:00:00      11     idle deeper-sdv[06-16]
kn1           up      20:00:00       1     drain kn101
kn1           up      20:00:00       3     idle kn1[04-06]
kn1256        up      20:00:00       1     drain kn101
kn1256        up      20:00:00       1     idle kn105
kn1272        up      20:00:00       2     idle kn1[04,06]
snc4          up      20:00:00       1     idle kn105
extoll        up      20:00:00      11     idle deeper-sdv[06-16]
ml-gpu        up      20:00:00       3     idle ml-gpu[01-03]
dp-cn         up      20:00:00       1     drain dp-cn33
dp-cn         up      20:00:00       5     resv dp-cn[09-10,25,49-50]
dp-cn         up      20:00:00      44     idle dp-cn[01-08,11-24,26-32,34-48]
dp-dam        up      20:00:00       1     drain* dp-dam08
dp-dam        up      20:00:00       2     drain dp-dam[03,07]
dp-dam        up      20:00:00       3     resv dp-dam[05,09-10]
dp-dam        up      20:00:00       2     alloc dp-dam[01,04]
dp-dam        up      20:00:00       8     idle dp-dam[02,06,11-16]
dp-dam-ext    up      20:00:00       2     resv dp-dam[09-10]
dp-dam-ext    up      20:00:00       6     idle dp-dam[11-16]
dp-esb        up      20:00:00      51     drain* dp-esb[11,26-75]
dp-esb        up      20:00:00       2     drain dp-esb[08,23]
dp-esb        up      20:00:00       2     alloc dp-esb[09-10]
dp-esb        up      20:00:00      20     idle dp-esb[01-07,12-22,24-25]
dp-sdv-esb    up      20:00:00       2     resv dp-sdv-esb[01-02]
psgw-cluster  up      20:00:00       1     idle nfgw01
psgw-booster  up      20:00:00       1     idle nfgw02
debug         up      20:00:00       1     drain* dp-dam08
debug         up      20:00:00       4     drain dp-cn33,dp-dam[03,07],kn101
debug         up      20:00:00      10     resv dp-cn[09-10,25,49-50],dp-dam[05,09-10],dp-sdv-esb[01-02]
debug         up      20:00:00       2     alloc dp-dam[01,04]
debug         up      20:00:00      69     idle deeper-sdv[06-16],dp-cn[01-08,11-24,26-32,34-48],dp-dam[02,06,11-16],kn1[04-06]
```

Please refer to the man page for `sinfo` for more information.

Can I join stderr and stdout like it was done with `-joe` in Torque?

Not directly. In your batch script, redirect stdout and stderr to the same file:

```
#!/sh ... #SBATCH -o /point/to/the/common/logfile-%j.log #SBATCH -e /point/to/the/common/logfile-%j.log ...
```

(The `%j` will place the job id in the output file). N.B. It might be more efficient to redirect the output of your script's commands to a dedicated file.
