File Systems

Available file systems

On the DEEP system, three different groups of file systems are available:

- the [?JSC GPFS file systems](#), provided via [?JUST](#) and mounted on all JSC systems;
- the DEEP parallel BeeGFS file systems, available on all the nodes of the DEEP system;
- the file systems local to each node.

The users home folders are placed on the shared GPFS file systems. With the advent of the new user model at JSC ([?JUMO](#)), the shared file systems are structured as follows:

- **\$HOME:** each JSC user has a folder under `/p/home/jusers/`, in which different home folders are available, one per system he/she has access to. These home folders have a low space quota and are reserved for configuration files, ssh keys, etc.
- **\$PROJECT:** In JUMO, data and computational resources are assigned to projects: users can request access to a project and use the resources associated to it. As a consequence, each user can create folders within each of the projects he/she is part of (with either personal or permissions to share with other project members). For the DEEP-SEA project (for example), the project folder is located under `/p/project/deepsea/`. Here is where the user should place data, and where the old files generated in the home folder before the JUMO transition can be found.

The DEEP system doesn't mount the \$SCRATCH file systems from GPFS, as it is expected to provide similar functionalities with its own parallel and local file systems.

The deepv login node exposes the same file systems as the compute nodes, but it lacks a local scratch file system. Since /tmp is very limited in size on deepv please use \$SCRATCH instead (pointing to the project folder) or use e.g. the /pmem/scratch on the dp-dam partition \$LOCALSCRATCH on any other compute node when performing SW installation activities. **A quota has been introduced for /tmp on deepv to avoid clogging of this filesystem on the login node which will lead to several issues. Additionally, files in /dev/shm, /tmp and /var/tmp older than 7 days will be removed regularly** ""

The following table summarizes the characteristics of the file systems available in the DEEP and (SDV) systems. **Please beware that the `$project` (all lowercase) variable used in the table only represents any JuDoor project the user might have access to, and that it is not really exported on the system environment.** For a list of all projects a user belongs to, please refer to the user's [?JuDoor page](#). Alternatively, users can check the projects they are part of with the `jutil` application:

```
$ jutil user projects -o columns
```

Sl. No.	Project Name	Project Description	Project Status	Project Manager	Project Start Date	Project End Date	Project Budget	Project Actual Cost	Project Variance	Project Risk	Project Impact
1	Project A	Project A Description	Completed	Project Manager A	2020-01-01	2020-03-31	1000000	950000	50000	Low	High
2	Project B	Project B Description	In Progress	Project Manager B	2020-04-01	2020-06-30	2000000	1800000	200000	Medium	Medium
3	Project C	Project C Description	On Hold	Project Manager C	2020-07-01	2020-09-30	3000000	2500000	500000	High	Low
4	Project D	Project D Description	Planned	Project Manager D	2020-10-01	2020-12-31	4000000	3500000	500000	Low	Medium
5	Project E	Project E Description	Completed	Project Manager E	2021-01-01	2021-03-31	5000000	4800000	200000	Medium	High
6	Project F	Project F Description	In Progress	Project Manager F	2021-04-01	2021-06-30	6000000	5500000	500000	High	Medium
7	Project G	Project G Description	On Hold	Project Manager G	2021-07-01	2021-09-30	7000000	6000000	1000000	Low	Low
8	Project H	Project H Description	Planned	Project Manager H	2021-10-01	2021-12-31	8000000	7000000	1000000	Medium	Medium
9	Project I	Project I Description	Completed	Project Manager I	2022-01-01	2022-03-31	9000000	8500000	500000	High	High
10	Project J	Project J Description	In Progress	Project Manager J	2022-04-01	2022-06-30	10000000	9000000	1000000	Low	Medium

Notes

- dd test @dp-dam01 of the DCPMM in appdirect mode:

```
[root@dp-dam01 scratch]# dd if=/dev/zero of=./delme bs=4M count=1024 conv=sync
1024+0 records in
1024+0 records out
4294967296 bytes (4.3 GB) copied, 1.94668 s, 2.2 GB/s
```

- The /work file system which is available in the DEEP-EST prototype, is as well reachable from the nodes in the SDV (including KNLs and ml-gpu nodes) but through a slower connection of 1 Gb/s. The file system is therefore not suitable for benchmarking or I/O task intensive jobs from those nodes

For moving data between /p/* and /arch, please use JUDAC instead of performing these actions on the login node (deepv). This helps avoiding congestion on the Just connection:

```
ssh -l <username> judac
mv /p/... /arch/...
```
