

## **Wikiprint Book**

**Title:** Offloading computational tasks of hybrid MPI + OpenMP/OmpSs-2 ...

**Subject:** DEEP - Public/User\_Guide/Offloading\_hybrid\_apps

**Version:** 24

**Date:** 04.05.2024 05:46:33

## Table of Contents

<b>Offloading computational tasks of hybrid MPI + OpenMP/OmpSs-2 applications to GPUs</b>	<b>3</b>
Quick Overview	3
NBody Benchmark	3
Description	3
Requirements	3

## Offloading computational tasks of hybrid MPI + OpenMP/OmpSs-2 applications to GPUs

Table of contents:

- [Quick Overview](#)
- Examples:
  - [NBody Benchmark](#)

### Quick Overview

### NBody Benchmark

Users can clone or download this examples from the <https://pm.bsc.es/gitlab/DEEP-EST/apps/NBody> repository and transfer it to a DEEP working directory.

### Description

An NBody simulation numerically approximates the evolution of a system of bodies in which each body continuously interacts with every other body. A familiar example is an astrophysical simulation in which each body represents a galaxy or an individual star, and the bodies attract each other through the gravitational force.

N-body simulation arises in many other computational science problems as well. For example, protein folding is studied using N-body simulation to calculate electrostatic and *Van der Waals* forces. Turbulent fluid flow simulation and global illumination computation in computer graphics are other examples of problems that use NBody simulation.

### Requirements

The requirements of this application are shown in the following lists. The main requirements are:

- **GNU Compiler Collection.**
- **OmpSs-2:** OmpSs-2 is the second generation of the **OmpSs** programming model. It is a task-based programming model originated from the ideas of the OpenMP and StarSs programming models. The specification and user-guide are available at <https://pm.bsc.es/ompss-2-docs/spec/> and <https://pm.bsc.es/ompss-2-docs/user-guide/>, respectively. OmpSs-2 requires both **Mercurium** and **Nanos6** tools. Mercurium is a source-to-source compiler which provides the necessary support for transforming the high-level directives into a parallelized version of the application. The Nanos6 runtime system library provides the services to manage all the parallelism in the application (e.g., task creation, synchronization, scheduling, etc). Downloads at <https://github.com/bsc-pm>.
- **Clang + LLVM OpenMP** (derived):
- **MPI:** This application requires an MPI library supporting the multi-threading level of thread support.

In addition, there are some optional tools which enable the building of other application versions:

- **CUDA and NVIDIA Unified Memory** devices: This application has CUDA variants in which some of the N-body kernels are executed on the available GPU devices.
- **Task-Aware MPI (TAMPI):** The Task-Aware MPI library provides the interoperability mechanism for MPI and OpenMP/OmpSs-2. Downloads and more information at <https://github.com/bsc-pm/tampi>.
